DeGroote

Preliminaries

Frequency based branching heuristic: MOHP

Heuristic for BCP based look-ahead branching

## Preliminaries

<ロト < 回 ト < 目 ト < 目 ト 目 の < C 3/21

<ロト < 団ト < 臣ト < 臣ト E のQで 4/21

 ILP: minimization problem with integer, binary, and continuous variables

- ILP: minimization problem with integer, binary, and continuous variables
  - Linear objective and constraints

- ILP: minimization problem with integer, binary, and continuous variables
  - Linear objective and constraints
- PBO: ILP with binary variables

- ILP: minimization problem with integer, binary, and continuous variables
  - Linear objective and constraints
- PBO: ILP with binary variables
  - Can be solved using ILP solvers such as CPLEX

DeGroote

DeGroote

Advantages

Deal with objective function

- Deal with objective function
- Integrality gap for hard problems

- Deal with objective function
- Integrality gap for hard problems
- Disadvantages

- Deal with objective function
- Integrality gap for hard problems
- Disadvantages
  - Poor scaling upon distribution [Ralphs, T., Shinano, Y., Berthold, T., Koch, T.(2018)]

- Deal with objective function
- Integrality gap for hard problems
- Disadvantages
  - Poor scaling upon distribution [Ralphs, T., Shinano, Y., Berthold, T., Koch, T.(2018)]
  - Dependency on pseudo-cost updates from other parts of the search tree

#### Incorporate SAT/PBO branching heuristics into CPLEX

- Incorporate SAT/PBO branching heuristics into CPLEX
  - Only use properties of the node being branched (compare to pseudo-Cost branching)

- Incorporate SAT/PBO branching heuristics into CPLEX
  - Only use properties of the node being branched (compare to pseudo-Cost branching)
  - Quality must be comparable to CPLEX strong branching (best available for ILPs)

- Incorporate SAT/PBO branching heuristics into CPLEX
  - Only use properties of the node being branched (compare to pseudo-Cost branching)
  - Quality must be comparable to CPLEX strong branching (best available for ILPs)
- But SAT/PBO branching heuristics are not designed to handle the objective function !

- Incorporate SAT/PBO branching heuristics into CPLEX
  - Only use properties of the node being branched (compare to pseudo-Cost branching)
  - Quality must be comparable to CPLEX strong branching (best available for ILPs)
- But SAT/PBO branching heuristics are not designed to handle the objective function !
  - Modify the popular Maximal Occurance in Minimal Size heuristic (MOMS)

- Incorporate SAT/PBO branching heuristics into CPLEX
  - Only use properties of the node being branched (compare to pseudo-Cost branching)
  - Quality must be comparable to CPLEX strong branching (best available for ILPs)
- But SAT/PBO branching heuristics are not designed to handle the objective function !
  - Modify the popular Maximal Occurance in Minimal Size heuristic (MOMS)
  - Proposed heuristics can also be used in existing PBO solvers

### Use case

- Less-than-truckload freight routing
- Commercially important (Multi-Billon dollar industry for companies like FedEX, UPS, Canada Post)

- Less-than-truckload freight routing
- Commercially important (Multi-Billon dollar industry for companies like FedEX, UPS, Canada Post)
- Real data from an industry partner

- Less-than-truckload freight routing
- Commercially important (Multi-Billon dollar industry for companies like FedEX, UPS, Canada Post)
- Real data from an industry partner
- ILP has many constraints with 2 variables (Boolean Constraint Propagation, BCP)

Estimate based

 Frequency of occurrence in constraints or the objective coefficient (SAT/PBO)

- Frequency of occurrence in constraints or the objective coefficient (SAT/PBO)
- Pseudo cost estimates (ILP)

Estimate based

- Frequency of occurrence in constraints or the objective coefficient (SAT/PBO)
- Pseudo cost estimates (ILP)

Look ahead based

- Frequency of occurrence in constraints or the objective coefficient (SAT/PBO)
- Pseudo cost estimates (ILP)
- Look ahead based
  - BCP for SAT/PBO

- Frequency of occurrence in constraints or the objective coefficient (SAT/PBO)
- Pseudo cost estimates (ILP)
- Look ahead based
  - BCP for SAT/PBO
  - Strong branching (ILP), but it is known that probing has a role to play in branching

- Frequency of occurrence in constraints or the objective coefficient (SAT/PBO)
- Pseudo cost estimates (ILP)
- Look ahead based
  - BCP for SAT/PBO
  - Strong branching (ILP), but it is known that probing has a role to play in branching
- First few branching decisions are vitally important ! (for both SAT and ILP) [Heule, M. J., Kullmann, O., Wieringa, S., & Biere, A. (2011, December).]

# Frequency based branching heuristic: MOHP

<ロト < 回ト < 目ト < 目ト < 目ト 目 のの() 10/21

 Recall: MOMS heuristic quickly gets rid of large volumes of infeasible space

- Recall: MOMS heuristic quickly gets rid of large volumes of infeasible space
  - High branching priority to variables in the smaller size constraints

- Recall: MOMS heuristic quickly gets rid of large volumes of infeasible space
  - High branching priority to variables in the smaller size constraints
- In the presence of an objective function, we change the priority definition that MOMS uses

- Recall: MOMS heuristic quickly gets rid of large volumes of infeasible space
  - High branching priority to variables in the smaller size constraints
- In the presence of an objective function, we change the priority definition that MOMS uses
  - quickly get rid of infeasible vertices which have very low objective function values

- We convert constraints into no-goods
  - $x_1+x_2 >=1$  converts to the nogood {( $x_1=0$ ), ( $x_2=0$ )} [Eén, N., & Sörensson, N. (2006).]

- $x_1+x_2 >=1$  converts to the nogood {( $x_1=0$ ), ( $x_2=0$ )} [Eén, N., & Sörensson, N. (2006).]
- A nogood is unit hypercube in n-dimensional space every vertex of which is infeasible

- $x_1+x_2 >=1$  converts to the nogood {( $x_1=0$ ), ( $x_2=0$ )} [Eén, N., & Sörensson, N. (2006).]
- A nogood is unit hypercube in n-dimensional space every vertex of which is infeasible
- Then we assign a priority to each no-good

- $x_1+x_2 >=1$  converts to the nogood {( $x_1=0$ ), ( $x_2=0$ )} [Eén, N., & Sörensson, N. (2006).]
- A nogood is unit hypercube in n-dimensional space every vertex of which is infeasible
- Then we assign a priority to each no-good
  - REMEMBER: we want to get rid of the best unconstrained vertex (if its infeasible), PLUS

- $x_1+x_2 >=1$  converts to the nogood {( $x_1=0$ ), ( $x_2=0$ )} [Eén, N., & Sörensson, N. (2006).]
- A nogood is unit hypercube in n-dimensional space every vertex of which is infeasible
- Then we assign a priority to each no-good
  - REMEMBER: we want to get rid of the best unconstrained vertex (if its infeasible), PLUS
  - also get rid of infeasible vertices in the vicinity that have low objective values

#### Nogood Priority

Reference point is defined for each variable in the nogood as = 0.5

- Reference point is defined for each variable in the nogood as = 0.5
  - Can use the linear relaxed fractional value of the variable (simplex)

# Nogood Priority

- Reference point is defined for each variable in the nogood as = 0.5
  - Can use the linear relaxed fractional value of the variable (simplex)
- The priority of a variable fixing (x<sub>i</sub>= v<sub>i</sub>) is defined as the decrease in the objective function when x<sub>i</sub>'s value changes from the reference point to v<sub>i</sub>.

# Nogood Priority

- Reference point is defined for each variable in the nogood as = 0.5
  - Can use the linear relaxed fractional value of the variable (simplex)
- The priority of a variable fixing (x<sub>i</sub>= v<sub>i</sub>) is defined as the decrease in the objective function when x<sub>i</sub>'s value changes from the reference point to v<sub>i</sub>.
- Each no-good is assigned a priority that is equal to the sum of the priorities of its variable fixings.

  - Constraint<sub>5</sub>:  $x_1 + x_5 \leq 1$  priority -0.5 0.5 = -1

Branch on x<sub>2</sub> or x<sub>3</sub>, tie-break won by x<sub>2</sub>

#### MOHP observations

 Only consider those no-goods which render the best unconstrained vertex infeasible

- Only consider those no-goods which render the best unconstrained vertex infeasible
- If there aren't any such no-goods, then the best unconstrained vertex is a solution

- Only consider those no-goods which render the best unconstrained vertex infeasible
- If there aren't any such no-goods, then the best unconstrained vertex is a solution
- In a best-first search, this vertex is also the optimal solution

#### Heuristic for BCP based look-ahead branching

#### Motivation

<ロト < 合ト < 言ト < 言ト 言 の < C 16/21

Look-ahead branching based on Probing (BCP)

- Look-ahead branching based on Probing (BCP)
- Time consuming to run BCP with every variable that appears in constraints having 2 variables

- Look-ahead branching based on Probing (BCP)
- Time consuming to run BCP with every variable that appears in constraints having 2 variables
- Heuristic for running BCP with only a few such variables

#### Motivation

- Look-ahead branching based on Probing (BCP)
- Time consuming to run BCP with every variable that appears in constraints having 2 variables
- Heuristic for running BCP with only a few such variables
- Example: PROP heuristic [Li and Anbulagan, 1997]

 A trigger is a variable and its fixing (to 0 or 1) used to initiate BCP

- A trigger is a variable and its fixing (to 0 or 1) used to initiate BCP
- A dominated trigger is a trigger corresponding to a variable fixing that is caused by some other trigger

- A trigger is a variable and its fixing (to 0 or 1) used to initiate BCP
- A dominated trigger is a trigger corresponding to a variable fixing that is caused by some other trigger
- An APEX trigger is a trigger that is not dominated by any other trigger

- A trigger is a variable and its fixing (to 0 or 1) used to initiate BCP
- A dominated trigger is a trigger corresponding to a variable fixing that is caused by some other trigger
- An APEX trigger is a trigger that is not dominated by any other trigger
- Only variables from APEX triggers are considered for branching

- A trigger is a variable and its fixing (to 0 or 1) used to initiate BCP
- A dominated trigger is a trigger corresponding to a variable fixing that is caused by some other trigger
- An APEX trigger is a trigger that is not dominated by any other trigger
- Only variables from APEX triggers are considered for branching
- Branch on variables on the periphery of the implication graph

# Apex Triggers example

Apex triggers in the constraint set below are  $(x_4, 0)$  and  $(x_6, 1)$ . We branch on one of  $x_4$  or  $x_6$ , using maximin criteria

$$c1: x_{1} + x_{2} \ge 1$$
  

$$c2: x_{3} + x_{2} \le 1$$
  

$$c3: x_{3} + x_{5} \ge 1$$
  

$$c4: x_{7} + x_{4} \ge 1$$
  

$$c5: x_{1} + x_{7} \le 1$$
  

$$c6: x_{5} + x_{6} \le 1$$
